Modelling dependencies

Make it more likely that d executes, after a has been executed.

Discovery

	fired	enabled	prefix
$\langle a, b, d \rangle \rightarrow$	a	{a, c}	[]
	b	{b}	[a ¹]
	d	{d, e}	[a ¹ , b ¹]

Discovery

	base weight	adjustment weight				
		a	b	c	d	e
a	+	+	+	+	+	+
b	+	+	+	+	+	+
c	+	+	+	+	+	+
d	+	+	+	+	+	+
e	+	+	+	+	+	+

Reductions:

- ▶ Only observed together
- ▶ χ^2 test of independence
- ▶ ...

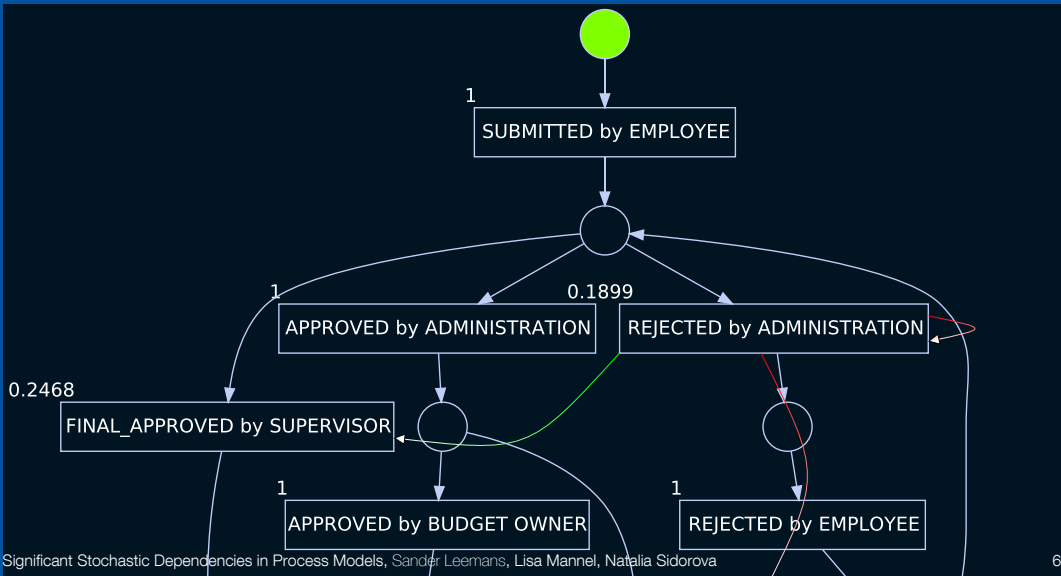

Discovery

Optimise a non-convex problem to find the remaining weight parameters

Post-process the results with more reductions

The result

You have been watching...

- ▶ Stochastic dependencies & how to model them
- ▶ Discovering stochastic dependencies
- ▶ A visualisation

Future work

- ▶ Use better optimisers
- ▶ Reductions on arbitrary Petri nets (without using the log)
